

# TRIPHERON®

## TRIPHERON® TUTABS

Pheromone lures for the Tomato Leafminer *Tuta absoluta*

### Monitoring

- Delta traps are suitable in the open field and in greenhouses.
- Use 1-2 traps per 1.000 m<sup>2</sup> in green houses and 2-6 traps per ha in the open field. Minimum number of traps is always two with a minimum of 20m distance between the traps.
- Place traps at a height of approx. 1,50 m between the plants. Make sure that the entrance of the trap is not blocked by leaves.

### Mass Trapping

- Water Traps can be used for mass trapping, both in the open field as well as in greenhouses. The TUTABS pheromone lure is placed above the surface. A detergent added to the water increases the efficiency.
- Place traps in every 4<sup>th</sup> row with a distance between the traps of 20m to 25m OR 20-40 traps per ha. Net covered greenhouses require the higher numbers. Minimum number of traps is always two.
- Place water traps on the ground or at a level of 30cm maximum.

### Handling

- Install traps at the time of (trans-) planting
- Inspection of the traps twice a week minimum
- Replace lures after 6 to 8 weeks
- Store lures in sealed original bag in a cold place (refrigerator, deep freezer)
